Assignment 05, Question 1

Jeff Nguyen

24/04/2021

University of Southern California Marshall School of Business FBE 543 Forecasting and Risk Analysis

#Question 1

```
library(quantmod)

# Set start date and end date of data
start_date <- "2014-01-01"
end_date <- "2021-03-24"

# Get data
getSymbols("JPM", src = "yahoo", , from = start_date, to = end_date)

## [1] "JPM"

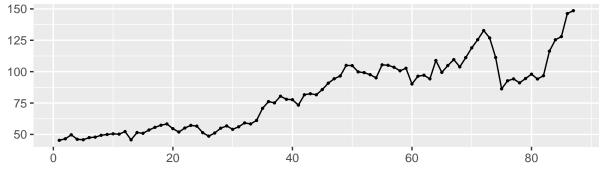

adjJPM_mo <- to.monthly(JPM)$JPM.Adjusted # Monthly Adjusted Closing Price
rJPM_mo <- diff(log(adjJPM_mo))[-1] # Monthly Returns</pre>
```

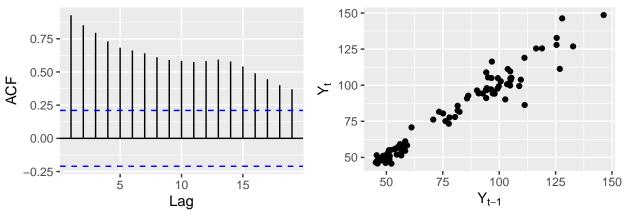

Data Observation:

Observing monthly adj. closing prices:

```
library(forecast)
ggtsdisplay(adjJPM_mo, main="JP Morgan Monthly Adj. Close Price", plot.type="scatter")
```

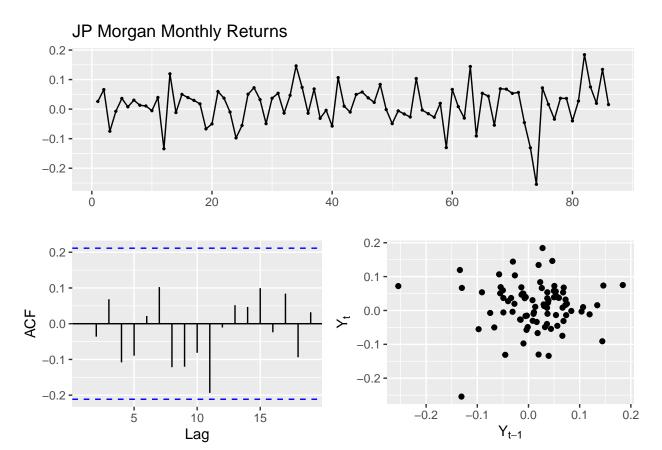

Observing monthly returns:

ggtsdisplay(rJPM_mo, main="JP Morgan Monthly Returns", plot.type="scatter")

Remarks

[2,]

1 2.14

0.990

We can see JPM's monthly adjusted closing price' lag plots exhibit a linear pattern, implying that the data is strongly non-random and thus, a first-order autoregressive model might be appropriate.

$$y_t = \beta_0 + \beta_1 y_{t-1} + \epsilon_t \tag{1}$$

On the other hand, JPM's monthly returns's lag plot does not exhibit any obvious patterns, implying that the data is strongly random.

1. Test for the stationarity of the adjusted closing prices for JPM.

We run Augmented Dickey Fuller Test for JPM. Recall that the null hypothesis for Dickey-Fuller Test is that a unit root is present in our autoregressive model, meaning the variable is a non-stationary variable.

```
library(aTSA)
adf.test(adjJPM_mo)

## Augmented Dickey-Fuller Test
## alternative: stationary
##
## Type 1: no drift no trend
## lag ADF p.value
## [1,] 0 2.39 0.990
```

```
## [3,]
          2 2.08
                    0.990
## [4,]
          3 1.87
                    0.983
## Type 2: with drift no trend
##
             ADF p.value
        lag
## [1,]
          0 2.15
                     0.99
## [2,]
          1 2.00
                     0.99
## [3,]
          2 2.07
                     0.99
                     0.99
## [4,]
          3 1.75
## Type 3: with drift and trend
##
        lag ADF p.value
## [1,]
          0 3.23
                     0.99
## [2,]
          1 3.13
                     0.99
          2 3.25
## [3,]
                     0.99
## [4,]
          3 3.03
                     0.99
## ----
## Note: in fact, p.value = 0.01 means p.value <= 0.01
```

We can observe p - value = .99 > .05. Thus, we fail to reject the null hypothesis. In other words, JPM monthly adjusted closing price has a unit root and therefore, is a non-stationary variable.

2. Test for the stationarity of the returns for JPM.

Similarly, we run (A)DF test for JPM's monthly returns:

```
adf.test(rJPM_mo)
```

```
## Augmented Dickey-Fuller Test
## alternative: stationary
##
## Type 1: no drift no trend
##
        lag
              ADF p.value

          2 14.50
                      0.99
## [4,]
          3 16.67
                      0.99
## Type 2: with drift no trend
              ADF p.value
##
        lag
          0 9.12
## [1,]
                      0.99
## [2,]
          1 13.08
                      0.99
          2 15.36
                      0.99
## [3,]
## [4,]
          3 17.93
                      0.99
## Type 3: with drift and trend
##
        lag
              ADF p.value
## [1,]
          0 9.08
                      0.99
## [2,]
          1 13.00
                      0.99
## [3,]
          2 15.27
                      0.99
## [4,]
          3 17.82
                      0.99
## ----
## Note: in fact, p.value = 0.01 means p.value <= 0.01
```

We can observe p - value = .99 > .05. Thus, we fail to reject the null hypothesis. In other words, JPM monthly returns has a unit root and therefore, is a non-stationary variable.

3. Run the best ARIMA model for JPM returns.

ACF1

Training set -0.001524886

We run auto ARIMA:

##

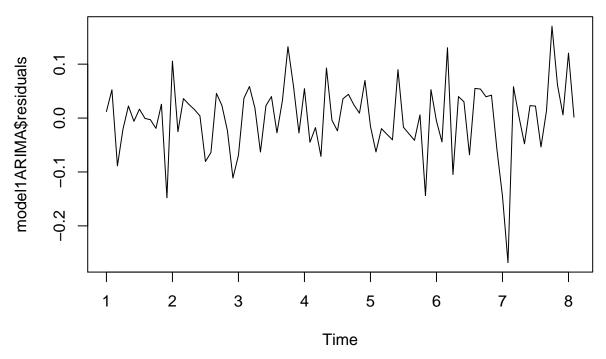

```
model1ARIMA <- auto.arima(rJPM_mo)</pre>
summary(model1ARIMA)
## Series: rJPM_mo
## ARIMA(0,0,0) with non-zero mean
##
## Coefficients:
##
           mean
##
         0.0138
## s.e. 0.0072
## sigma^2 estimated as 0.004526: log likelihood=110.59
                 AICc=-217.03 BIC=-212.27
## AIC=-217.18
##
## Training set error measures:
                                                         MPE
##
                          ME
                                    RMSE
                                                MAE
                                                                 MAPE
                                                                            MASE
## Training set 3.987334e-20 0.06688026 0.04967865 117.2023 122.2534 0.6404292
```

We can see that with ARIMA(0,0,0), we have great ACF1 statistics, implying a good fit for forecasting.

4. Test for the existence of heteroskedasticity on the residuals of the JPM's ARIMA model.

```
plot(model1ARIMA$residuals, main="Plot of Residuals")
```

Plot of Residuals

Testing for hetereoskedacity on the residuals of the ARIMA model above:

11. Run an ARCH and/or GARCH model on JPM's returns data.

```
library(rugarch)
# Write Specification of Your GARCH Model using "sGrach" or standard GARCH Mode.
garch1 <- ugarchspec(variance.model=list(model="sGARCH", garchOrder=c(1, 1)), mean.model=list(armaOrder-</pre>
# Fit the Model to Data
garch1_rJPM_mo <- ugarchfit(spec=garch1, data=rJPM_mo)</pre>
garch1_rJPM_mo
##
